The Coconut Palm (Cocos nucifera L.) - Research and Development Perspectives V. Krishnakumar, P. K. Thampan, M. Achuthan Nair, 2019-02-15 Since the publication of The coconut palm A monograph in 1960 considerable information has been accrued on the crop through work at research institutes international organisations and development agencies Although coconut cultivation is spread over 93 countries providing employment and creating livelihood opportunities to 64 million families around the globe smallholder coconut farmers are now facing numerous challenges The wide gap between the potential and actual yield is a major concern and as such it is necessary to disseminate knowledge in order to implement research findings Coconut research in India one of the leading coconut producing countries is celebrating its centenary making this an opportune time to review the research and development advances and the relevant technologies This detailed comprehensive book covers all aspects of coconut from the origins to cultivation breeding physiology and value addition as well as subjects of topical interest like nutrition and health biotechnology and climate change and carbon sequestration Written by leading experts in the fields it emphasises that the livelihood of the small coconut landholders is the ultimate aim of scientists and developmental agencies and outlines various important strategies to make coconut farming more remunerative globally It discusses work in all the major coconut growing countries and outlines suggestions for international cooperation Research work on the crop is comparatively difficult because of its perennial nature longevity height long juvenile phase large sized nuts cross pollination and seed propagation As these special features necessitate greater investment of resources time and land it is all the more imperative that research is not duplicated and the information and experience becoming available around the world is shared so that it can be fully utilised In this context periodic publications compiling all the available information on coconut assume greater significance This book is therefore of great value to researchers students extension workers developmental agencies and progressive farmers

Morphological Plant Modeling: Unleashing Geometric and Topological Potential within the Plant Sciences Alexander Bucksch, Dan Chitwood, 2017-10-13 An increasing population faces the growing demand for agricultural products and accurate global climate models that account for individual plant morphologies to predict favorable human habitat Both demands are rooted in an improved understanding of the mechanistic origins of plant development Such understanding requires geometric and topological descriptors to characterize the phenotype of plants and its link to genotypes However the current plant phenotyping framework relies on simple length and diameter measurements which fail to capture the exquisite architecture of plants The Research Topic Morphological Plant Modeling Unleashing Geometric and Topological Potential within the Plant Sciences is the result of a workshop held at National Institute for Mathematical and Biological Synthesis NIMBioS in Knoxville Tennessee From 2-4 September 2015 over 40 scientists from mathematics computer science engineering physics and biology came together to set new frontiers in combining plant phenotyping with recent results from shape theory at the interface of geometry and topology In doing so the Research Topic synthesizes the views from multiple disciplines to reveal the potential of new mathematical concepts to analyze and quantify the relationship between morphological plant features As such the Research Topic bundles examples of new mathematical techniques including persistent homology graph theory and shape statistics to tackle questions in crop breeding developmental biology and vegetation modeling The challenge to model plant morphology under field conditions is a central theme of the included papers to address the problems of climate change and food security that require the integration of plant biology and mathematics from geometry and topology research applied to imaging and simulation techniques The introductory white paper written by the workshop participants identifies future directions in research education and policy making to integrate biological and mathematical approaches and to strengthen research at the interface of both disciplines

Molecular Plant Abiotic Stress Aryadeep Roychoudhury, Durgesh Kumar Tripathi, 2019-06-13 A close examination of current research on abiotic stresses in various plant species. The unpredictable environmental stress conditions associated with climate change are significant challenges to global food security, crop productivity, and agricultural sustainability. Rapid population growth and diminishing resources necessitate the development of crops that can adapt to environmental extremities. Although significant advancements have been made in developing plants through improved crop breeding practices and genetic manipulation, further research is necessary to understand how genes and metabolites for stress tolerance are modulated and how cross talk and regulators can be tuned to achieve stress tolerance. *Molecular Plant Abiotic Stress: Biology and Biotechnology* is an extensive investigation of the various forms of abiotic stresses encountered in plants and susceptibility or tolerance mechanisms found in different plant species. In-depth examination of morphological, anatomical, biochemical, molecular, and gene expression levels enables plant scientists to identify the different pathways and signaling cascades involved in stress response. This timely book covers a wide range of abiotic stresses in multiple plant species. Provides researchers and scientists with transgenic strategies to overcome stress tolerances in several plant species. Compiles the most recent research and up-to-date data on stress tolerance. Examines both selective breeding and genetic engineering approaches to improving plant stress tolerances. Written and edited by prominent scientists and researchers from across the globe. *Molecular Plant Abiotic Stress: Biology and Biotechnology* is a valuable source of information for students, academics, scientists, researchers, and industry professionals in fields including agriculture, botany, molecular biology, biochemistry, and biotechnology, and plant physiology.

Tropical Trees and Forests F. Halle, R.A.A. Oldeman, P.B. Tomlinson, 2012-12-06

Trees I Y. P. S. Bajaj, 2012-12-06 Biotechnology has come to a stage where by replacing some of the age-old practices of breeding, it can produce novel and improved plants and animals that can better serve human beings and their purposes. The techniques of cellular and subcellular engineering such as gene splicing and recombinant DNA cloning, hybridomas, and monoclonal antibody production, human insulin protein engineering, industrial fermentation, artificial insemination, cryopreservation, and ovum transfer, plant tissue culture, and somatic hybridization, nitrogen fixation, phytomass production for biofuels, etc. have advanced greatly in the past decade due to the availability of better equipment and the consolidation of knowledge. Product orientation has removed biotechnology from the area of pure academic interest to one of utility where the final product is a spur to action. Businesses have started pouring money into projects which has aided greatly in improving equipment, information exchange, and arousing the interest and imagination of the public. The common goal of science, industry, and the public opens wide vistas and great hopes for biotechnology. The business of biotechnology addresses itself to issues of factory farming, technology transfer, joint ventures, international cooperation, and to specific topics as well as the production of diagnostic kits. Industry is particularly concerned with the pharmaceutical field and microbial biotechnology from which profitable return can accrue. Commercial interests have led to better management practices and systematization.

Palms of controversies Alain Rival, Patrice Levang, 2014-07-17 The rapid development of oil palm cultivation feeds many social issues such as biodiversity deforestation food habits or ethical investments How can this palm be viewed as a miracle plant by both the agro food industry in the North and farmers in the tropical zone but a serious ecological threat by non governmental organizations NGOs campaigning for the environment or rights of local indigenous peoples In the present book the authors a biologist and an agricultural economist describe a global and complex tropical sector for which the interests of the many different stakeholders are often antagonistic Oil palm has become emblematic of recent changes in North South relationship in agricultural development Indeed palm oil is produced and consumed in the South its trade is driven by emerging countries although the major part of its transformations is made in the North that still hosts the largest multinational agro industries It is also in the North that the sector is challenged on ethical and environmental issues Public controversy over palm oil is often opinionated and it is fed by definitive and sometimes exaggerated statements Researchers are conveying a more nuanced speech which is supported by scientific data and a shared field experience Their work helps in building a more balanced view moving attention to the South the region of exclusive production and major consumption of palm oil
