Analytical Modeling Study of Acute Lymphoblastic Leukemia Treatment with Blinatumomab and Tyrosine Kinase Inhibitors

Lauren Onweller, 2022 Acute Lymphoblastic Leukemia ALL is a blood based cancer that accounts for 30% of all pediatric cancer patients and is the second most common type of acute leukemia in adult cancer patients 1 ALL is an aggressive form of cancer with an average survival rate of only 5 years suggesting that novel treatment options are needed Treatment methods such as chemotherapy are often unsuccessful at treating ALL as they are not specific and can lead to relapses 2 Two therapeutics of interest are bispecific T cell engagers biTEs and tyrosine kinase inhibitors TKIs both of which address the specificity issues that arise with chemotherapy BiTEs also known as bispecific antibodies are comprised of two monoclonal antibodies held together by a peptide linker One end of the biTE binds to CD3 T cells and the other end binds to CD19 B cells These can be used in cancer therapeutics to recruit immune cells to the site of cancer cells TKIs work to inhibit their respective tyrosine from phosphorylating tyrosine residues and inhibit pathways downstream of the phosphorylation in the malignant B cells There are ongoing clinical trials on treatment of Philadelphia Chromosome positive Ph B cell ALL with the combination of TKIs and the biTE blinatumomab One clinical trial investigated treating the ALL with blinatumomab and ponatinib and the other investigated blinatumomab with dasatinib The rationale behind this combination is to inhibit kinase activity in malignant B cells while also promoting an immune response through activating T cell receptors and recruiting T cells 3 However previous studies have found that when used in combination TKIs involved with the Src family kinases and biTEs have an antagonistic effect on cancer treatment 4 5 Through in vitro experimentation and mathematical modeling it is possible to explore the antagonism mechanism of TKIs and biTE combination therapy

Bispecific Antibodies Roland E. Kontermann, 2011-07-21 The concept of using bispecific antibodies for cancer therapy by retargeting immune effector cells was developed several years ago Initial clinical studies were rather disappointing mainly due to low efficacy severe side effects and the immunogenicity of the bispecific antibodies The progress in antibody engineering finally led to the generation of new classes of bispecific antibodies lacking these obstacles In addition new applications were established such as pre targeting strategies in radioimmunotherapy and dual targeting approaches in order to improve binding selectivity and efficacy In this book the different ways of generating bispecific antibodies are described with emphasis on recombinant formats The various applications of bispecific antibodies e g in cellular cancer immunotherapy radioimmunotherapy and pretargeting strategies are covered and emerging applications such as dual targeting strategies which involve the simultaneous inhibition of two targets are addressed
