| **Experimentation and Evaluation of IPv6 Secure Neighbor Discovery Protocol** ,2007 The DoD is expected to transition to IPv6 networking within the next few years The IPv6 Neighbor Discovery Protocol is responsible for autoconfiguration and neighbor address resolution which establishes hosts on the network and allows communication between hosts IPsec the default security mechanism for IPv6 does not allow for automatic protection of the autoconfiguration process Thus the Secure Neighbor Discovery Protocol SeND was created SeND uses Cryptographically Generated Addresses CGA and asymmetric cryptography as a first line of defense against attacks on integrity and identity It claims to achieve mutual authentication of hosts and routers without the need for a Certification Authority CA This thesis evaluates this claim by building a test bed of SeND enabled hosts The major findings include i SeND does not really offer mutual authentication without a CA and ii SeND is susceptible to CPU exhaustion attacks |

*Neighbor Discovery Proxy-Gateway* Luis Maqueda Ara,2012-03 6LoWPAN is an adaptation layer that permits the transport of IPv6 packets over low power IEEE 802 15 4 networks However an important protocol tightly coupled to IPv6 Neighbor Discovery has proven to be unsuitable for IEEE 802 15 4 network links For this reason the IETF has defined a number of optimizations to adapt the traditional Neighbor Discovery protocol to non transitive wireless links While these optimizations result in a more efficient use of the resources of hosts within 6LoWPAN networks they introduce a number of impediments for communication between traditional IPv6 nodes and 6LoWPAN nodes This work describes how to overcome these obstacles by providing the necessary proxy and forwarding mechanisms to integrate 6LoWPAN nodes into existing IPv6 networks Since the integration method proposed here requires no changes in the network infrastructure nor human intervention the entire process occurs in a transparent seamless and cost effective manner In particular this thesis details the requirements specification implementation and evaluation of an embedded device responsible for such integration a 6LoWPAN Neighbor Discovery Proxy Gateway 6LP GW

*Secure Neighbor Discovery in Wireless Networks* Srikanth Hariharan,Ness B. Shroff,Saurabh Bagchi,2011-01 Wireless ad hoc networks especially sensor networks are increasingly being used for data monitoring in commercial industrial and military applications Security is of great concern from many different viewpoints ensuring that sensitive data does not fall into wrong hands ensuring that the received data has not been doctored and ensuring that the network is resilient to denial of service attacks This book studies the fundamental problem of secure neighbor discovery which is critical to protecting the network against a number of different forms of attacks In wireless ad hoc and sensor networks neighbor discovery is one of the first steps performed by a node upon deployment and disrupting it adversely affects a number of routing MAC topology discovery and intrusion detection protocols It is especially harmful when an adversary can convince nodes that it is a legitimate neighbor which it can do easily and without the use of cryptographic primitives This book discusses a secure neighbor discovery protocol SEDINE for static multihop wireless networks and extensively analyze its performance
