Christopher Daniel Widmer, 2015 NAT traversal presents a challenge to Peer to Peer P2P applications as in many instances a third party is needed to help initiate communication between two hosts when one is behind one or more NAT devices Much work has gone into facilitating communication across NATs using various protocols and several standards have been developed to this end This thesis explores the advantages and disadvantages of several of these standards including protocols for interacting with the NAT device itself NAT Port Mapping Protocol NATP PMP Port Control Protocol PCP and Universal Plug and Play UPnP and those using an external server to obtain the external facing address and port mapping of a client Session Traversal Utilities for NAT STUN The results from a small series of performance tests are also described A common technique for maintaining connections through NATs is to use some form of keep alive message so that the connection mapping in the NAT device will not expire This thesis explores several existing methods for encoding and scheduling keep alive messages In addition it introduces a new state based technique STUN Calc Keep Alive as an extension of the STUN protocol for calculating an appropriate keep alive interval for a User Datagram Protocol UDP connection with the current network configuration and efficiently adapting to NAT mapping lifetime changes In addition to having the algorithm run on a dedicated connection two possible implementations for running the algorithm using a single channel or on the same connection as other application traffic are described
