Inhibition Of Return

Inhibition of Return with Multiple Shifts of Attention [microform] Dodd, Michael D,2005 Inhibition of return IOR refers to the finding that targets at cued locations are responded to more slowly than targets at uncued locations when a relatively long interval occurs between the two events An early and still dominant explanation is that IOR is a mechanism that biases us toward novelty to increase the efficiency of search This idea has rarely been explicitly tested however given a lack of agreement regarding how to measure IOR in search tasks The present thesis uses variations of the multiple cuing paradigm to address two noticeable gaps in the IOR literature relating to visual search These results fit with both attentional and oculomotor accounts of IOR and suggest a strong role for IOR in visual search with its influence increasing as the number of shifts of attention increases Collectively these findings shed considerable light on IOR It appears to be faster acting longer lasting and more pervasive than originally thought Second the magnitude of IOR is greater at more recently cued locations Experiments 4 7 attempted to discriminate two explanations for this pattern decay as a function of time vs interference from intervening cues Across experiments time was held constant and the number of cues preceding target onset was manipulated Counter intuitively the results demonstrated that IOR increased as the number of cues on a trial increased suggesting that IOR might actually increase as attention continually shifts during visual search Accordingly IOR is observed outside of the normal temporal parameters with continual shifts of attention in Experiment 8 First although there is some evidence consistent with IOR influencing visual search there is no explicit evidence that IOR can accrue to a recently attended location if attention is rapidly shifted to new locations every 50 ms the speed at which attention is thought to shift in normal visual search In Experiments 1 3 participants observed cues that were of either a short 50 ms or long 500 ms duration prior to a detection target The results showed that IOR can accrue at up to four locations with multiple rapid shifts of attention quickly enough to facilitate visual search

Inhibition of Return is Mediated by Object Identity Helen M. Morgan,2005

Attention Addie Johnson,Robert W. Proctor,2004 Attention Theory and Practice provides a balance between a readable overview of attention and an emphasis on how theories and paradigms for the study of attention have developed The book highlights the important issues and major findings while giving sufficient details of experimental studies models and theories so that results and conclusions are easy to follow and evaluate Rather than brushing over tricky technical details the authors explain them clearly giving readers the benefit of understanding the motivation for and techniques of the experiments in order to allow readers to think through results models and theories for themselves Attention is an accessible text for advanced undergraduate and graduate students in psychology as well as an important resource for researchers and practitioners interested in gaining an overview of the field of attention

Inhibition of Return: Neural Basis and Function M. I. Posner,R. D. Rafal,L. S. Choate,J. Vaughan,OREGON UNIV EUGENE DEPT OF PSYCHOLOGY.,1984 A goal of neuropsychology is to connect cognitive functions with underlying neural systems Posner in press has proposed a framework for doing so in which elementary mental operations in cognitive models are expressed in terms of component facilitations and inhibitions in the performance domain These components are in turn linked to underlying neural systems In the area of spatial attention one such component is the tendency to inhibit orienting toward visual locations which have been previously attended inhibition of return The current studies use patients and normals to demonstrate the relationship of this component to systems which generate saccades These mid brain systems appear to contribute specific components to the generation of programs for visual attention The deficits found in patients and the conditions under which the inhibition is found in normals suggest that inhibition of return may function to favor foveation of information at new locations

Inhibition of Return Skye Eva Howard,2016 Inhibition of return IOR refers to the finding that response times RTs to targets are longer when targets are presented at a recently attended to location relative to targets at new locations The motor based component of IOR was explored by investigating the contributions of M1 to IOR Transcranial magnetic stimulation TMS was used to determine if the mechanisms associated with IOR are represented in M1 Participants completed a cue target task with non predictive exogenous cues It was hypothesized that if the mechanisms underlying IOR are represented in M1 then the motor evoked potentials MEPs associated with the cued or uncued responses would mirror RTs TMS of M1 altered RTs however MEP data did not reveal an effect of cue location on M1 excitability The data indicate a motor contribution to the IOR effect but the question of where in the motor system the mechanisms associated with IOR is localized is unanswered

The Oxford Handbook of Eye Movements Simon Liversedge, Iain Gilchrist, Stefan Everling, 2011-08-18 In the past few years there has been an explosion of eye movement research in cognitive science and neuroscience. This has been due to the availability of off the shelf eye trackers along with software to allow the easy acquisition and analysis of eye movement data. Accompanying this has been a realisation that eye movement data can be informative about many different aspects of perceptual and cognitive processing. Eye movements have been used to examine the visual and cognitive processes underpinning a much broader range of human activities including language production, dialogue, human computer interaction, driving behaviour, sporting performance and emotional states. Finally in the past thirty years there have been real advances in our understanding of the neural processes that underpin eye movement behaviour. The Oxford Handbook of Eye Movements provides the first comprehensive review of the entire field of eye movement research. In over fifty chapters it reviews the developments that have so far taken place, the areas actively being researched and looks at how the field is likely to develop in the coming years. The first section considers historical and background material before moving onto section 2 on the neural basis of eye movements. The third and fourth sections look at visual cognition and eye movements and eye movement pathology and development. The final sections consider eye movements and reading and language processing and eye movements. Bringing together cutting edge research from an international team of leading psychologists, neuroscientists and vision researchers, this book is the definitive reference work in this field.

The Parietal Lobe, 2018-03-05 The Parietal Lobe Volume 151, the latest release from the Handbook of Clinical Neurology series, provides a foundation on the neuroanatomy, neurophysiology and clinical neurology/neuropsychology of the parietal lobe that is not only applicable to both basic researchers and clinicians but also to students and specialists who are interested in learning more about disorders brought on by damage or dysfunction. Topics encompass the evolution, anatomy, connections and neurophysiology of the major neurological and neuropsychological deficits and syndromes caused by damage, the potential for improvement via transcranial stimulation and the role of the parietal lobe in the cerebral networks for perception and action. Provides a broad overview of the neuroanatomy, neurophysiology and clinical neurology of this region of the cortex. Offers additional insights regarding the role of the parietal lobe in the cerebral networks for perception and action. Addresses the most frequent complications associated with damage, including somatosensory, perceptual, language and memory deficits, pain, optic ataxia, spatial neglect, apraxia and more. Edited work with chapters authored by global leaders in the field. Presents the broadest, most expert coverage available.

Spatial Biases in Perception and Cognition Timothy L. Hubbard, 2018-08-23 Numerous spatial biases influence navigation, interactions and preferences in our environment. This volume considers their influences on perception and memory.
