Plant Strategies Daniel C. Laughlin, 2023-07-27 How do plants make a living Some plants are gamblers others are swindlers Some plants are habitual spenders while others are strugglers and miserly savers Plants have evolved a spectacular array of solutions to the existential problems of survival and reproduction in a world where resources are scarce disturbances can be deadly and competition is cut throat Few topics have both captured the imagination and furrowed the brows of plant ecologists yet no topic is more important for understanding the assembly of plant communities predicting plant responses to global change and enhancing the restoration of our rapidly degrading biosphere The vast array of plant strategy models that characterize the discipline now require synthesis These models tend to emphasize either life history strategies based on demography or functional strategies based on ecophysiology Indeed this disciplinary divide between demography and physiology runs deep and continues to this today The goal of this accessible book is to articulate a coherent framework that unifies life history theory with comparative functional ecology to advance prediction in plant ecology Armed with a deeper understanding of the dimensionality of life history and functional traits we are now equipped to quantitatively link phenotypes to population growth rates across gradients of resource availability and disturbance regimes Predicting how species respond to global change is perhaps the most important challenge of our time A robust framework for plant strategy theory will advance this research agenda by testing the generality of traits for predicting population dynamics
