Psychopharmacology Algorithms David Osser, 2020-09-22 Algorithms serve an important purpose in the field of psychopharmacology as heuristics for avoiding the biases and cognitive lapses that are common when prescribing for many conditions whose treatment is based on complex data. Unique in the field, this title compiles twelve papers from the Psychopharmacology Algorithm Project at the Harvard South Shore Psychiatry Residency Training Program and presents practical ways to adopt evidence-based practices into the day-to-day treatment of patients. *Psychopharmacology Algorithms* is a useful resource for practicing psychiatrists, residents, and fellows, as well as psychiatric nurse practitioners, psychiatric physician assistants, who prescribe advanced practice pharmacists who prescribe, and primary care clinicians. Magnesium in the Central Nervous System Robert Vink, Mihai Nechifor, 2011 The brain is the most complex organ in our body Indeed it is perhaps the most complex structure we have ever encountered in nature Both structurally and functionally there are many peculiarities that differentiate the brain from all other organs The brain is our connection to the world around us and by governing nervous system and higher function any disturbance induces severe neurological and psychiatric disorders that can have a devastating effect on quality of life Our understanding of the physiology and biochemistry of the brain has improved dramatically in the last two decades In particular the critical role of cations including magnesium has become evident even if incompletely understood at a mechanistic level The exact role and regulation of magnesium in particular remains elusive largely because intracellular levels are so difficult to routinely quantify Nonetheless the importance of magnesium to normal central nervous system activity is self evident given the complicated homeostatic mechanisms that maintain the concentration of this cation within strict limits essential for normal physiology and metabolism There is also considerable accumulating evidence to suggest alterations to some brain functions in both normal and pathological conditions may be linked to alterations in local magnesium concentration This book containing chapters written by some of the foremost experts in the field of magnesium research brings together the latest in experimental and clinical magnesium research as it relates to the central nervous system It offers a complete and updated view of magnesium's involvement in central nervous system function and in so doing brings together two main pillars of contemporary neuroscience research namely providing an explanation for the molecular mechanisms involved in brain function and emphasizing the connections between the molecular changes and behavior It is the untiring efforts of those magnesium researchers who have dedicated their lives to unraveling the mysteries of magnesium's role in biological systems that has inspired the collation of this volume of work

THERAPEUTIC ACTUALITIES IN THE MANAGEMENT OF BIPOLAR DISORDER IN THE DEPRESSIVE PHASE Achour Loubna, 2017

Introduction Bipolar depression still poorly understood represents 30 to 50% of depressed patients and is the main source of morbidity in bipolar disorder. The current therapeutic modalities proposed in the management of this depressive phase are in perpetual controversy so various algorithms are regularly proposed and new molecules are tested. Thymoregulators are currently recommended in first intention however the place of antipsychotics and antidepressants remains unclear. The objective of our study is to update the different modes of management of bipolar disorder in the depressive phase.

Methodology This is a descriptive study performed on medical records to describe the management of patients who are consultants or hospitalized at the Ar razi de Salu00e9 Hospital with bipolar disorder in the depressive phase. This is done with the help of a heterogeneous questionnaire identifying the different data and evaluating the therapeutic attitudes in the management of bipolar disorder in the depressive phase.

Results In our sample of 45 patients the average age is 34.6 years. An age range between 18 and 63 years old. All our patients are under a combination of antipsychotics and mood stabilizers. Approximately 44.4% of our patients were placed on sodium valproate and 28.9% on lamotrigine, 15.6% on carbamazepine and 11.1% on lithium. Nearly 51.1% of our patients were on olanzapine and 20% on quetiapine. In our sample 37 patients 80% were put on antidepressant. A percentage of 46.7% of our patients were put on Sertraline, 15.6% on Escitalopram, 15.6% on Fluoxetine and 4.4% on Paroxetine.

Conclusion The management of bipolar depressions remains complex and a major therapeutic challenge for the practitioner. The development of second generation antipsychotics in bipolar depression is an interesting step forward in the underpinning of our therapeutic arsenal. The place of antidepressants in bipolar depression is controversial. Their prescription is based on clinical expertise and requires an adjustment on a case by case basis.

Brain disorders neurological psychiatric and developmental now affect at least 250 million people in the developing world and this number is expected to rise as life expectancy increases. Yet public and private health systems in developing countries have paid relatively little attention to brain disorders. The negative attitudes prejudice and stigma that often surround many of these disorders have contributed to this neglect. Lacking proper diagnosis and treatment millions of individual lives are lost to disability and death. Such conditions exact both personal and economic costs on families communities and nations. The report describes the causes and risk factors associated with brain disorders. It focuses on six representative brain disorders that are prevalent in developing countries: developmental disabilities, epilepsy, schizophrenia, bipolar disorder, depression and stroke. The report makes detailed recommendations of ways to reduce the toll exacted by these six disorders. In broader strokes the report also proposes six major strategies toward reducing the overall burden of brain disorders in the developing world.
