The Structure of Mitochondria E. A. Munn, 2014-06-28 The Structure of Mitochondria provides an extensive account of the structure of mitochondria This book illustrates the variety of mitochondrial structure revealed by electron microscopy of intact cells Organized into nine chapters this book begins with an overview of the application of electron microscopy to the study of the structure of cells and their mitochondria This text then explains the short term changes of the type revealed by phase contrast microscopy of living cells Other chapters consider the rationale behind the procedures generally employed for the isolation of mitochondria and other sub cellular components This book discusses as well the important component of mitochondria The final chapter describes the interesting similarities of mitochondria chloroplasts and bacteria and the bearing these have on the concept about the way in which the relationships between mitochondria and the rest of the eukaryotic cell have evolved This book is a valuable resource for biologists physiologists and bacteriologists

Investigation of the mitochondrial contact site and cristae organizing system and its role in cristae formation Till Stephan, 2020 Mitochondria are essential organelles in eukaryotic cells that feature a unique doublemembrane architecture The mitochondrial inner membrane forms numerous invaginations named cristae which can adopt different shapes and sizes The cristae membrane harbors the protein machinery that facilitates the function of mitochondria as powerhouses of the cell Small openings referred to as crista junctions connect the cristae membrane to the inner boundary membrane which runs in parallel to the outer membrane The intricate shape of the inner membrane is determined by a set of membrane shaping

The Dynamic Nature of Mitochondria Andreas S. Reichert, 2024-04-15 Mitochondrial research has exploded over the last 150 years This book gives an amazing view on a conceptual change in our understanding of mitochondrial biology It becomes clear that mitochondria are extremely dynamic in nature controlling life at multiple levels Mitochondria rule energy conversion adapt cells well to changing stress and nutrient conditions and regulate many cellular processes including immunity The dynamic nature of mitochondria occurs at an intramitochondrial level but also includes its ability to interact with other organelles and to modulate multiple signalling pathways It is thus not surprising that alterations or inability to ensure this dynamic behaviour is linked to ageing and human diseases The following sections give an updated view on mitochondria Mitochondrial ultrastructure molecular mechanisms shaping the inner membrane Mitochondrial cristae and lipid dynamics from super resolution microscopy to lipid OXPHOS interplay Mitochondrial control of cellular homeostasis from redox signalling to interorganellar contact sites Mitochondria in health and disease from mtDNA release to Complex I assembly Advanced methods in mitochondrial biology and metabolism research Integrative view on mitochondrial research and outlook The field of mitochondrial research has always been full of surprises and has helped science to advance tremendously It developed hand in hand with landmark developments in technology such as super resolution microscopy nanoscopy and is currently influencing an increasing number of scientific disciplines There is still much new to find out about this old organelle and I think that you can find interesting and also unexpected aspects of mitochondrial biology in this book I hope the book will enhance your scientific curiosity and inspire your own research

Wiring the Adaptive Response of Mitochondria to Metabolic Transitions Aditi Sood, 2015 It is well established in cultured models that mitochondrial dynamics and cristae remodeling regulate mitochondrial function under different stress conditions such as starvation and apoptosis Despite the tremendous amount of research in this field relatively little is known about the significance of mitochondrial dynamics and ultrastructure remodeling under normal physiological conditions in vivo In the 1960 s Hackenbrock demonstrated that isolated mitochondria adopt distinct internal conformations under different metabolic states Based on these observations he predicted that mitochondrial ultrastructural changes regulate the organelles functional output However whether these ultrastructural changes also accompany metabolic transitions in vivo under physiological conditions is not known Further hepatic metabolism requires mitochondria to adapt their bioenergetic and biosynthetic output to the ever changing anabolic catabolic state of the liver cell but the wiring of this process is still largely elusive In this study we provide the first in vivo quantitative description of the adaptive response of the mitochondrial reticulum to hepatic metabolic transitions Using a postprandial mouse liver model and quantitative cryo EM analysis we show that at 5 hours after feeding the mTORC1 signaling is blocked the mitochondria network fragments the cristae density decreases and the mitochondrial respiratory capacity drops These changes are accompanied with a parallel increase in the mitochondria ER contact MERCs lengths which control calcium and phospholipids fluxes between the two organelles Further these events are associated with the transient expression of two previously unidentified C terminal fragments CTFs of Optic atrophy 1 OPA1 a mitochondrial GTPase that regulates cristae and mitochondrial dynamics Using an in vitro assay we show that these CTFs originate from a novel OPA1 processing termed C cleavage that eliminates OPA1 activity by breaking off the GTPase Importantly we show that C cleavage requires the presence of Mitofusin 2 MFN2 a key regulator of mitochondria fusion and MERCs biogenesis but not that of its homolog Mitofusin 1 MFN1 thereby linking cristae remodeling to MERCs assembly
